SYSTEM DESCRIPTION
The U-Coat 3000 waterproofing membrane system is a user-friendly, liquid applied, waterproofing membrane. The system uses one or two coats of a fast setting, water catalyzed polyurethane coating and protection board. It is an elastomeric system designed to expand and contract with normal structural movements. The U-Coat 3000 waterproofing system has a wide range of uses for both vertical and horizontal applications. Installed properly, the U-Coat 3000 waterproofing system will ensure years of dependable waterproofing protection.

FEATURES
- Applied at any thickness.
- Non-gassing.
- Quick curing.
- May be applied on green concrete
- Monolithic Membrane.
- High solids.

TYPICAL USES
- Under tile.
- Between slabs.
- Green roofs.
- Restrooms.
- Basements.
- Tunnels.
- Foundation walls.
- Bridges.
- Planters.
- I.R.M.A. roofs.
- Wood surfaces.

PRODUCT INSTRUCTIONS
For complete information associated with the application of all U-Coat Product systems and products, refer to the General Guidelines and Technical Bulletin sections of the U-Coat Products catalog, which describes the products, surface preparation, job conditions, finishing details and other necessary information.

APPLICATION
Phase 1: Check area of application to ensure it conforms to substrate requirements. Prime all metal, joints and cracks with U-Coat Primer 2180.

Phase 2: Prime the surface with U-Coat Primer 2180 at a rate of 1 gallon/300 square feet. Apply using brush, airless sprayer or phenolic core roller. This will result in 3 dry mils (76 microns) of coating. Allow U-Coat Primer 2180 to dry one hour before (and become tack free) before proceeding to Phase 3.

Phase 3: The first coat of U-Coat 3000 should be applied at a rate of 2 gallons/100 sq. ft. (0.8 liters/m²) resulting in a 30 ± 2 dry mils (762 ± 51 microns) membrane. Allow to cure before applying second coat.

Phase 4: The second coat of U-Coat 3000 should be applied at a rate of 2 gallons/100 sq. ft. (0.82 liters/m²) resulting in a 30 ± 2 dry mils (762 ± 51 microns) membrane. At 75°F (24°C) and 50% relative humidity, allow a minimum of 24 hours before checking watertightness.

Phase 5: To ensure integrity of the system a flood test should be performed according to the following procedure:
Step One: Waterproofed area shall be flood tested for 24 hours after system has cured and prior to installation of protection course.
Step Two: Plug drains and place barriers to contain the water.
Step Three: Flood test to a depth of 2 inches for the duration of the test.
Step Four: Repair any leaks that may appear.

Phase 6: Protect all exposed membrane surfaces by installing protection board as per manufacturers instructions, making sure to butt edges together.

FINISHED SYSTEM
When applied as directed above, the U-Coat 3000 waterproofing membrane system will provide 60 dry mils (1524 dry microns) of superior waterproofing protection. Any optional adhesion test is to be performed seven days after product application.

PACKAGING
U-Coat 3000: 1 gallon can or 5 gallon pail

LIMITATIONS
- The following conditions must not be coated with U-Coat Products coating systems or products: concrete over an unvented metal pan, magnesite, lightweight concrete, asphalt surfaces and asphalt overlays.
- Concrete must exhibit 3000-psi minimum strength. Concrete surfaces to be coated must be trowel finished in compliance with the American Concrete Institute (except that hand troweling is not required), followed by a fine hair brooming, left free of loose particles, and shall be without ridges, projections, voids and concrete droppings that would be mechanically detrimental to coating application or function.
- New concrete must be cured for 28 days.
- U-Coat coating systems should not be subjected to rising water tables or hydrostatic pressure on slab-on-grade decks.
- The only acceptable grade of plywood is APA rated exterior grade or better.
- The appearance and physical characteristics of the plywood and grade should be considered.
- Plywood should be new or cleaned and sanded.
- Equipment should be cleaned with a urethane grade environmentally safe solvent, as permitted under local regulations, immediately after use.
- Uncured materials are sensitive to heat and moisture.
- The substrate must be structurally sound and sloped for proper drainage.
- Umaco, Inc. assumes no responsibility for substrate defects.
- Do not apply to contaminated surfaces.
- Protection board must be used.
- Containers that have been opened must be used as soon as possible.
- Coating should be applied at least 5°F (3°C) above the dew point.
- Coverage rates recommended are based on lab conditions, applied at 75°F (24°C) ambient temperature and are intended to be minimum coverage rates on clean, smooth plywood, and are exclusive of additional amounts needed to fill potholes, spallings, scaling, rough and irregular surfaces.
- Porosity and roughness of the substrate, aggregate size, and product temperature will affect coverage rates.
- Material mil thickness rates are calculated on theoretical coverage for a smooth substrate and do not account for the actual texture or substrate conditions in the field or at the time of application.
- Sample mockups on the projects are recommended to determine the exact coverage rates necessary to waterproof the deck to acceptable standards.
- Field visits by Umaco personnel are for the purpose of making technical recommendations only and are not to supervise or provide quality control on the job site.

WARNING
The products in this system contain isocyanates and solvent.
